

Material Management

The QMRP™ Material Management module processes physical inventories and cycle counts, providing the tools required for efficient reconciliation of physical stock against inventory records. Programs within this module can automatically assign ABC classifications based on a variety of user-selected criteria.

Items can be selected for cycle counting based on random or non-random criteria. The random count can be processed through user-selected ABC classifications or throughout the entire base of inventory items. The non-random count method provides parameters for selection of the range, type, and locations of items to be processed.

Inventory tags, count deviation journals, and complete audit trails of physical adjustments are provided. Adjustments to the physical count can be made as needed prior to the final inventory update. Inventory master records are updated with final count figures on demand, including a final count deviation journal.

Highlights:

- User selects cycle count criteria by item number, a range of items, quantity on hand, quantity available, last count date, planner code, ABC class, or percentage of current usage.
- Items can be added to in-process cycle counts as required.
- ABC class is assigned by unit cost, unit cost times past usage, or unit cost times quantity on hand.
- Both inventory books and tags can be printed.
- Random and non-random cycle count by stock location is available.
- Inventory deviation journal includes unit cost and extended costs per item, total upward and downward adjustments, and beginning and ending (net) inventory cost.
- Inquiries display counts in progress, including status, location, and initiating department or person.
- Item count frequency can be updated during ABC class generation.
- Optional interface to G/L adjusts the inventory account with cycle count adjustments.
